WG40 Web Guide System

***Eliminates Print to Margin
Variation***

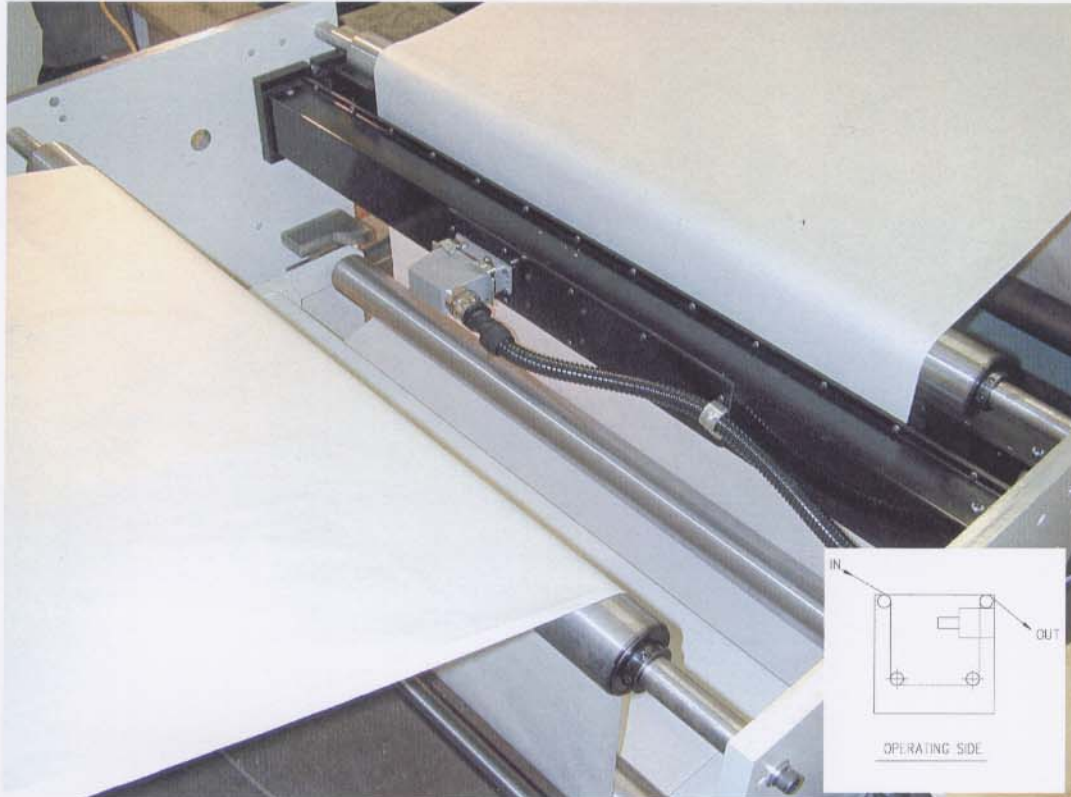

Eliminates Fold Variation

Reduces Make Ready Waste

Web Guide Systems by Jardis Industries provide the precise web alignment required to maintain print to margin register and accurate folding in modern high speed offset printing presses. A closed loop system, employing the "C-All" scanner bar is used to monitor the web and compensate for any incoming web sidelay variations. The result is a better printing job with less waste.

JARDIS INDUSTRIES, INC.

C-ALL WEB GUIDE

The "C-All" Web Guide provides press operators with the most advanced makeready features available in the web printing industry. The full width infrared scanning bar provides fully automatic set-up by virtue of the ability to identify any web size at any location within the press operating range. After selection of the web guide mode by the operator the system will lock on and maintain web position at the desired location. The additional feature of a web break output signal adds unparalleled press protection.
